

• 100% FREE · Live Cohort

👋 Hey beginners — this one's for you

Get started with Cloud & AI on AWS in just 5 days.

A friendly, **beginner-friendly intro** to AWS — no prior experience needed. Perfect for students, graduates, and anyone curious about cloud or AI.

- ✓ **Learn the essentials** — cloud, storage, compute, AI services
- ✓ **Hands-on demo on Day 5** — see AWS services working together
- ✓ **10 hours total** · live · 3 timezones to choose from

★★★★★

"Concepts are explained in a simple, step-by-step manner. Even advanced AWS topics feel clear and manageable."

Gururaj Rathod · DevOps Engineer

★★★★★

"I still go back to it as a reference. So much content — theory plus hands-on with real-world examples."

Antonio Villarán López · Cloud Architect

LIVE DATES

May 25 – 29

Mon to Fri · 2026 · 2 hrs/day

PICK YOUR TIMEZONE

EST 9:00 – 11:00 AM

GMT 2:00 – 4:00 PM

IST 6:30 – 8:30 PM

Save your seat at

iaasacademy.com

→ Limited live spots

Rajesh

Senior Solutions Architect
& Corporate Cloud Trainer

 Published Author · 2 Books

A bit about me

Senior Solutions Architect across the big three

Designing & engineering solutions on AWS, Azure, and Microsoft 365 — client-facing solutioning through to hands-on implementation.

Real-world experience across MSPs & enterprise

Delivered for multiple managed service providers and end clients, with deep experience in the insurance domain.

Corporate technical trainer since 2019

Partnering with L&D firms to identify real skills gaps and build bespoke IT & cloud training that solves them.

Published Author

2 books published through Packt — on cloud & technology

Let's connect on LinkedIn 🙋

Scan the code to connect with me directly — I'd love to follow your journey into cloud & AI.

What I hope you'll **take away** this week

Five things I want you to walk away with by Friday.

1

Confidence that this path is for you

A career in Cloud & AI is genuinely rewarding — and more accessible than you might think.

2

Why fundamentals matter more than ever

In an AI-driven world, strong IT and cloud foundations are what separate good engineers from great ones.

3

How to think, not just what to click

Learn to analyze a business problem and choose the right tech stack to solve it.

4

How real solutions come together

See how the best AWS services and tools combine to build something that actually works.

5

The momentum to keep going

Leave with the curiosity and drive to keep learning long after this week ends.

Agenda

- Day 1** ● What is cloud computing, AWS and Identity & access (IAM)
- Day 2** ● Introduction to Storage (Amazon S3), and content delivery (AWS CloudFront)
- Day 3** ● Compute (EC2, Lambda, ECS) and how services communicate (SQS, SNS)
- Day 4** ● A friendly intro to AWS AI services: Bedrock, Rekognition, Polly, Textract
- Day 5** ● Hands-on demo: Lambda, Textract, Bedrock, S3 and CloudFront chained together

FOR BEGINNERS · NO EXPERIENCE NEEDED

CLOUD & AI ON AWS

DAY 1 · Cloud Basics & **IAM**

<https://www.youtube.com/watch?v=oYQKIEyk6Kg>

MAY 25-29 · 2 HRS/DAY · • LIVE

An example AI tool...

Start with an idea

- Describe the app or website you want to create or drop in screenshots and docs

Watch it come to life

- See your vision transform into a working prototype in real-time as AI builds it for you

Refine and ship

- Iterate on your creation with simple feedback and deploy it to the world with one click

What is cloud computing?

The shift from owning servers to renting capability — and why it matters

Think of it like
electricity

OLDEN DAYS FACTORY

Factory generates its own power

LOUD

High noise & vibration

EXPENSIVE

High operating and maintenance cost

RISKY

Fire hazard, fuel handling risks, breakdown risks

NEEDS OWN DIESEL

Buy, store and manage diesel

LOUD • EXPENSIVE • RISKY • NEEDS OWN DIESEL

More Cost. More Risk. More Worry.

MODERN FACTORY

Just plugs into the powergrid

NO NOISE

Quiet and smooth operations

NO RISK

No fuel, no fire hazard, no breakdown risk

LOWER COST

No fuel cost, low maintenance

NO FUEL TO BUY

No need to buy, store or manage fuel

CLEAN • SAFE • RELIABLE • HASSLE-FREE

Lower Cost. Zero Risk. Peace of Mind.

It's the same store with technology

Before every company had their own data center (even if it was in the basement) – now everyone *rents* IT services from cloud providers...

BEFORE

- You buy the servers
- You house them in a data centre
- You maintain, patch, and replace them
- You pay whether you use them or not

AFTER — CLOUD

- Rent compute from AWS on demand
- No upfront hardware purchase
- AWS handles maintenance & security
- Pay only for what you actually use

Why does this matter to you?

Scale instantly

Handle 10 users or 10 million —
add capacity in minutes, not
months

Pay as you go

No upfront cost. Start small, grow
as your usage grows

Focus on building

AWS manages the infrastructure so
you can focus on your product

Cloud computing turned infrastructure from a capital expense into a utility — like paying a water bill, not building a reservoir.

The three service models

IaaS, PaaS, and SaaS — explained with real-world analogies

IaaS

PaaS

SaaS

Let's use a pizza analogy

Three ways to get pizza — three ways to use cloud. Same ingredients, very different relationships.

IaaS

BUILD THE KITCHEN YOURSELF

"You rent an empty building. No kitchen, no tables, nothing. You install every pipe, every oven, every counter — then you cook."

You manage: OS, servers, storage, networking, runtime
AWS provides: raw compute, power, physical hardware

e.g. Amazon EC2

Maximum control, maximum responsibility

PaaS

HAND OVER YOUR RECIPE

"You provide the recipe. The platform reads it and builds exactly the kitchen your dish needs — the right ovens, the right tools — then cooks and serves it. You never touch a piece of equipment."

You provide: your application code only
AWS builds, provisions & scales the infrastructure to fit your app

e.g. AWS Elastic Beanstalk

You focus on code, not infrastructure

SaaS

EAT AT THE RESTAURANT

"You did not build anything. You did not bring a recipe. You sit down, order, and enjoy the meal."

You use: the software as-is

Everything is managed — you just log in

e.g. Gmail, Salesforce, Zoom

No infrastructure decisions at all

Who manages what?

The real difference is how much AWS handles vs how much you handle.

Layer	IaaS	PaaS	SaaS
Applications	You	You	AWS
Data	You	You	AWS
Runtime	You	AWS	AWS
OS	You	AWS	AWS
Virtualisation	AWS	AWS	AWS
Servers & storage	AWS	AWS	AWS
Networking	AWS	AWS	AWS

You

 = you manage this layer

AWS

 = AWS manages this layer

The four (sorry...five) pillars of any application

Before we look at AWS services, we need to understand what every application is built on

Think of building a house

Every application needs the same four things — just like every house does.

Compute

THE WORKFORCE

"The builders on site. They do the actual work — lifting, assembling, making decisions. Without them, nothing gets done."

Processes your code, handles logic, responds to requests.

EC2, Lambda, ECS

Network

THE ROADS

"The roads, driveways and postal system. How people and materials get in, out, and between every part of the site."

Controls how data travels — in from users, out to the world, and between services.

VPC, CloudFront, Route 53

Storage

THE WAREHOUSE

"The warehouse next to the site. You store raw materials, finished goods, photos, documents — anything you might need later."

Holds files, images, videos, backups — anything unstructured.

S3, EBS, EFS

Database

THE FILING CABINET

"The architect's filing cabinet. Every blueprint, measurement and spec — organised, indexed, and retrievable in seconds."

Structured data you need to query, relate and search — user records, orders, transactions.

RDS, DynamoDB

Storage vs Database — what's the difference?

Beginners often mix these up. Here's the clearest way to think about it.

Storage

"A warehouse full of boxes"

You put things in, you get things out — by name., no searching inside.

GOOD FOR

Store a profile photo · Host a static website

Archive log files · Serve video to users

⚠ Cannot answer "find me all users who signed up last week"

Amazon S3

Database

"A filing cabinet with an index"

Every item is structured and labelled. You can ask questions — filter, sort, join, aggregate.

GOOD FOR

User accounts & profiles · Orders & transactions

Product catalogues · Any data you need to query

⚠ Not designed to store large files like videos or images

Amazon RDS / DynamoDB

How cloud computing is made possible

The Internet

THE HIGHWAY

"The road that connects you to AWS from anywhere in the world. Without it, there is no way to reach the platform, log in, or send instructions."

Every request you make — opening the console, launching a server, uploading a file — travels over the internet to AWS data centres.

Virtualisation

THE DIVIDER

"One physical server sliced into hundreds of isolated virtual ones. AWS can rent each slice to a different customer — all running at the same time, invisible to each other."

This is why you can spin up a server in seconds. There is no new hardware — just a new slice carved from existing machines.

[More on this in Day 3](#)

API Calls

THE LANGUAGE

"Every action in AWS is an instruction sent via an API. When you click Launch Instance in the console, AWS translates that click into an API call behind the scenes."

This is also how developers automate infrastructure — write code that sends API calls, and AWS provisions everything without anyone clicking a button.

Understanding API Calls

Think of ordering at a restaurant — the AWS REST API is the waiter

Step 1
Browse the menu

You

Developer
or Console

Step 2
Choose your order

AWS Docs

Browse available
service actions

Step 3
Waiter takes
your request

AWS REST API

Receives, validates
& routes requests

THE AWS REST API

Step 4
Kitchen prepares
the dish

AWS Service

EC2, S3, Lambda
etc. does the work

Step 5
Dish served
back to you

Result

Resource ready
in seconds

Every click in the AWS console is an API call in disguise — the REST API is the waiter that carries every instruction to the right service.

AWS Global Infrastructure

Global Datacenters – Global Presence

What is the Global Infrastructure?

– AWS - <https://aws.amazon.com/about-aws/global-infrastructure/>

AWS Global Infrastructure

The AWS Global Infrastructure comprises of:

- Regions
- Availability Zones
- Edge Locations
- Local Zones
- Wavelength Zones
- AWS Outpost

AWS Regions

Regions and Availability Zones

Availability Zones

- Each Region has a minimum of 3 Availability Zones
- Three Availability Zones in London - 100 km (60 miles) of each other
- Each AZ - one or more discrete data centers
- Redundant power, networking, and connectivity
- Interconnected with high-bandwidth, low-latency networking
- Synchronous replication between AZ's

AWS Availability Zones

How Companies Choose Regions

AWS Edge Locations

What is an Edge Location?

A data centre in a major city that caches copies of your content. When a user requests a file, it is served from the nearest edge — not your origin server.

Amazon CloudFront uses Edge Locations

- 1 User requests a file (image, video, page)
- 2 CloudFront checks the nearest edge for a cached copy
- 3 Cache HIT: served instantly from edge. Cache MISS: fetched from your origin (S3, EC2), cached for next time

600+

Edge Locations

90+

Cities globally

47+

Countries

Speed

Millisecond-level latency. Users get content from a server near them, not halfway across the world.

Security

Built-in DDoS protection via AWS Shield. HTTPS by default. Works with WAF for extra control.

Origin Support

Works with S3, EC2, load balancers, or any HTTP server — on AWS or elsewhere.

Custom Domains

Attach your own domain and SSL certificate. Your users see yoursite.com, not an AWS URL.

CloudFront manages edge locations automatically — point it at your origin and it handles the rest. Used in the Day 5 capstone.

Shared Responsibility Model

BEFORE WE START

You will need a free AWS account

To complete the hands-on project in this training, you will need your own AWS account. The video opposite shows you exactly how to set one up.

AWS gives you **USD 200** in free credits on sign up — more than enough for this entire course.

AWS Free Tier Setup

**How to Create an AWS
Free Tier Account**

youtu.be/uaUlz3NnZ8Y

@awstraining

Identity and Access Management

Accessing your AWS account, its services
and resources

The Root User

Actions only Root User can perform

What is an IAM User

AWS IAM – Identity and Access Management

AWS IAM

An independent identity that can be assumed by any entity with the permissions to do so. An IAM role grants temporary credentials to grant access to services and resources based on a set of predefined policies.

Create an IAM User

Stop logging on with the root user account unless you really need to...

Homework

- Create an AWS Free Plan Accounts
- Configure MFA
- Create an IAM User Account
- Assign Administrator Policy to IAM User
