AWS...

- Lambda must figure out:
- Is this a name?
 - Is this a section heading?
 - Is this a skill?
 - Is this a job title?
 - Is this company name?

That means writing lots of brittle parsing rules in Python

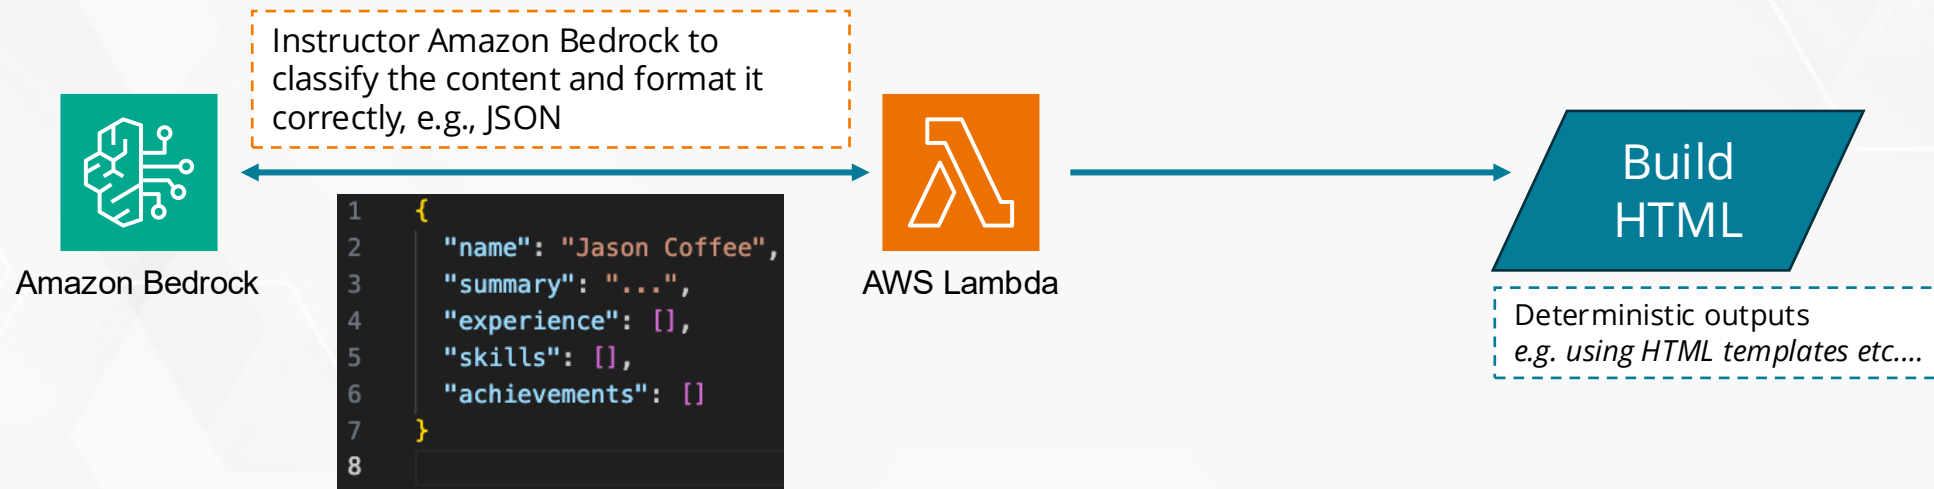

```
1 if "Professional Summary" in line:
2     ...
3 elif looks_like_date(line):
4     ...
5 elif maybe_skill(line):
6     ...
7
```

Resume Website Generator – The Tech

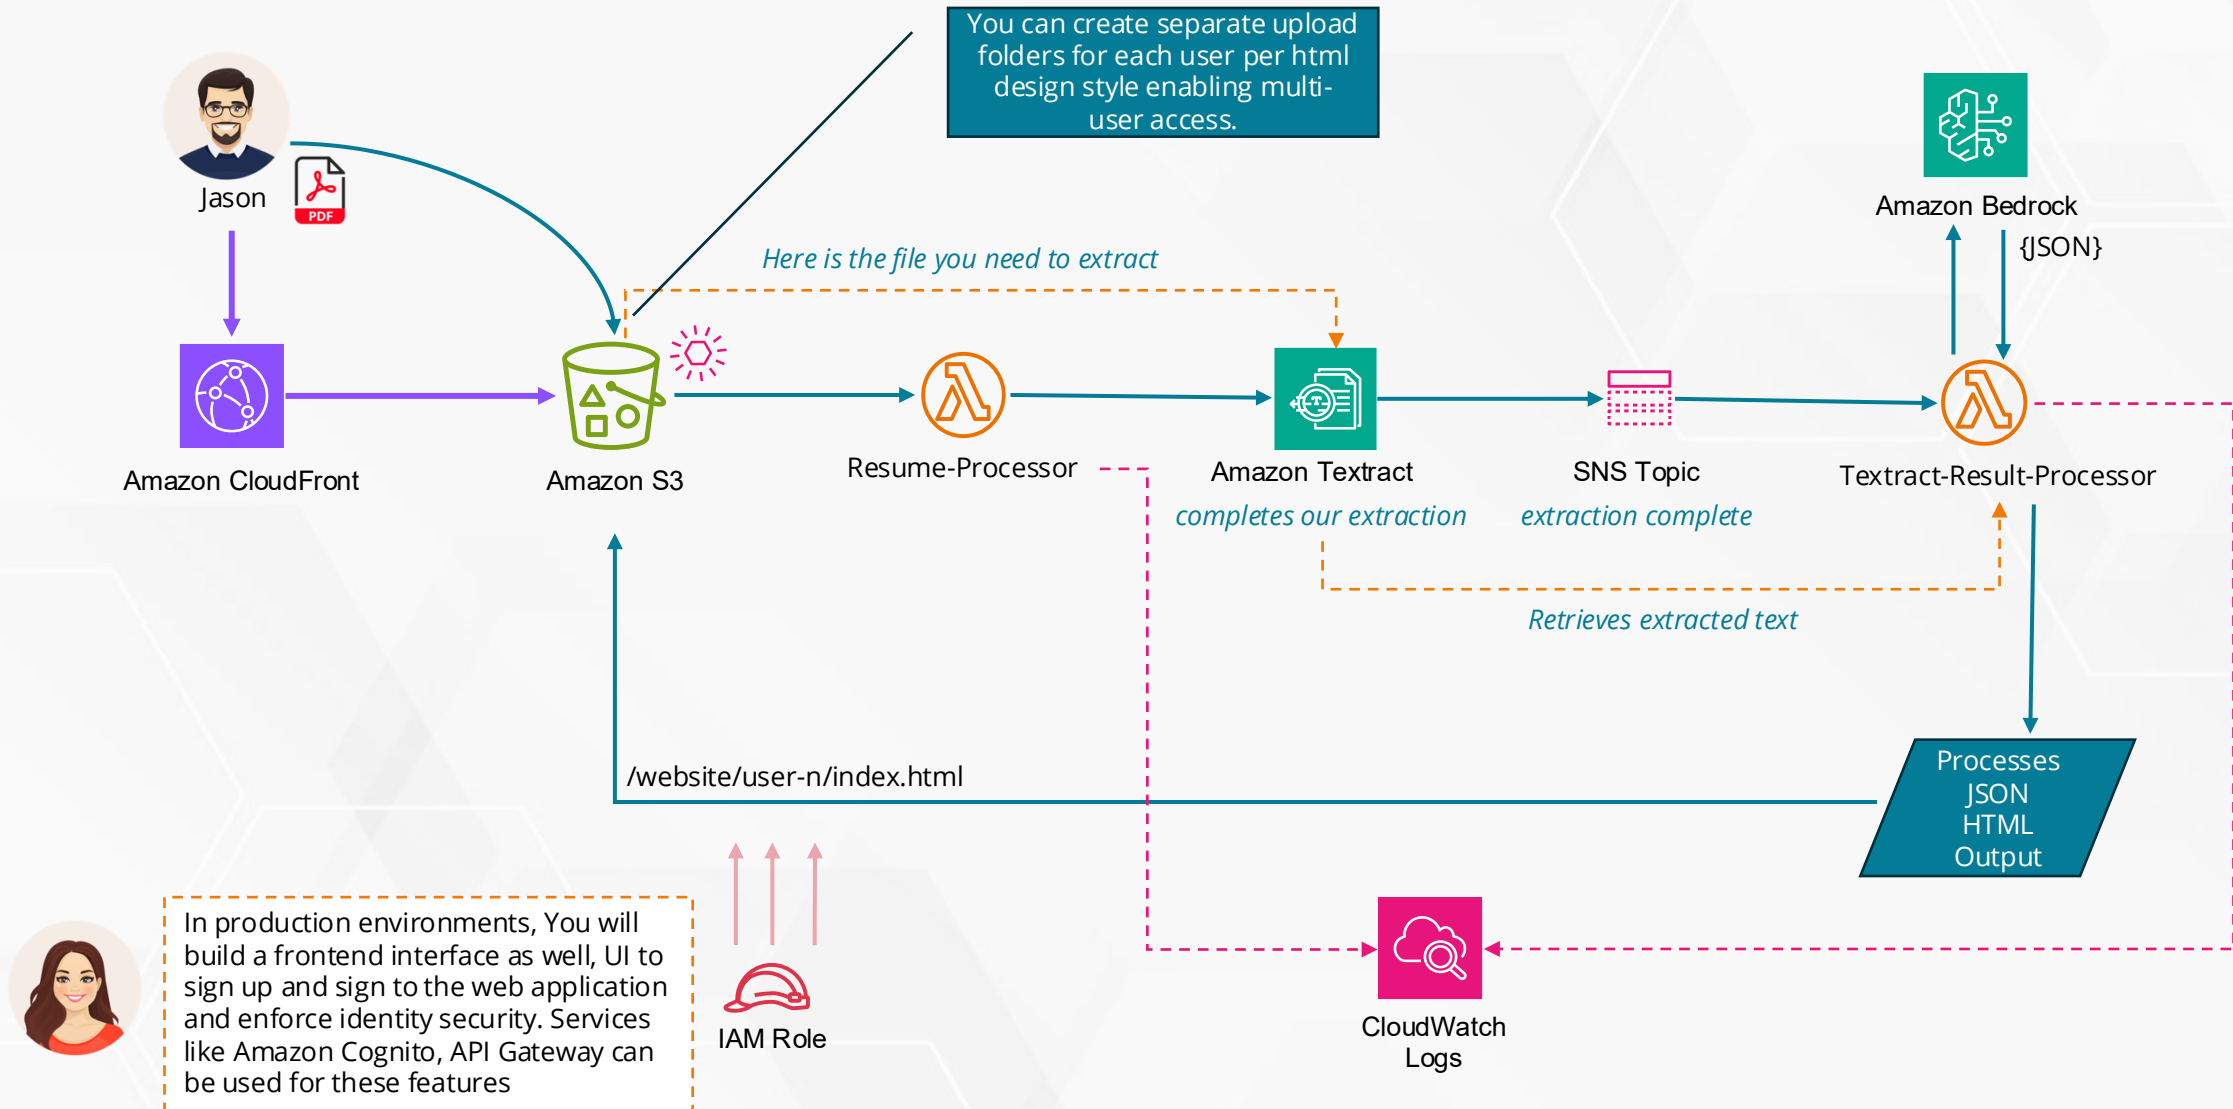

- Amazon Bedrock
 - Access Foundation Models and LLMs to classify the extracted data
 - Understand context of the extracted data
 - Format the data so that Lambda (Python) can understand what to do with it
in this case convert to JSON format
